

Wet and Wild

2021, Week 2 – Answers A Wet & Wild Birthday Bash

Have you worked out the common link yet?

Golden Sun Moth, (Synemon plana)

- 1. I am listed as critically endangered.
- 10. I'm a medium-sized, diurnal or day-flying moth. The wingspan of females and males is about 3.1 cm and 3.4 cm respectively.
- 11. I live in native grasslands which use to spread across NSW, the ACT, Vic and SA and have mainly Wallaby Grass. Less than 1% of these grasslands remain.
- 17. The larval stage of my life is probably two to three years and an adult moth for one to four days.
- 18. Males fly in a zig-zag pattern in the warmest part of the day. Females rarely fly.
- 22. From 100 to 150 eggs are laid in Wallaby Grass clumps between mid-October and early January.

Green and Golden Bell Frog (Litoria aurea)

- 2. I range in size from approximately 45 mm to approximately 100 mm.
- 3. I live in marshes, dams and creek edges, particularly where Cumbungi and other vegetation grows.
- 7. Tadpoles eat algae and other plant-matter; adults eat mainly insects, but also other frogs.
- 12. I'm a dull olive to a bright emerald-green colour on my back. I also have gold markings on my back.
- 16. I'm endangered in New South Wales and also live in eastern Victoria.
- 19. I'm preyed upon by introduced predators like mosquito fish and foxes but also snakes and wading birds.

Golden Bandicoot (Isoodon auratus)

- 4. I am the smallest of its genus and a threatened species.
- 8. I was once found throughout much of north western Australia, even down to NSW and SA however I now only live in a very small areas of WA and the NT.
- 9. I have a golden colour back, hence my common name, finely streaked with black fur.
- 15. I'm a nocturnal, omnivore, eating insects, plant bulbs, and small reptiles, digging small holes to find food.
- 20. My largest population lives on Barrow Island because no cats or foxes live on the island.
- 23. Females have a rear-opening pouch and a pregnancy of just two weeks.

Golden-crowned snake (Cacophis squamulosus)

- 5. I'm a small, nocturnal and venomous species, but not considered dangerous.
- 6. With a yellowish crown-shaped marking on my head which gives me my common name, my body is brown to grey above and pink below.
- 13. I'm found on the east coast and nearby ranges, from central NSW to south-eastern Qld.
- 14. My eggs are laid in January and hatch in March, with an average clutch of about six.
- 21. I live in deep forest and sandstone areas and shelter under stones, logs and leaf litter.
- 24. I search for sleeping reptiles by scent, and also eat frogs.
